

## **We just installed a new green marble foyer. The problem we are having is that the tiles are 1. curling up on the corners. Why is this occurring, and can it be corrected?**

Curling in green marble can be a serious problem when the marble is set in a wet mud or thin-set. The Marble Institute of America recommends that green marble be set with an epoxy-based compound. Check with the installer and see what has been used to set the marble. If mud or thin-set was used, the marble will have to be removed and reset in epoxy.

***TIP If you need to grind or hone a green marble floor, check the installation. If the tile was set with a water based material, the water you use to grind the floor may cause spalling.***
